DREGREES

DEGREE IN VIDEO GAME CREATION AND STORYTELLING

2021 | 2025

Francisco de Vitoria University

MASTER'S DEGREE IN VIDEO GAME DEVELOPMENT

2025 | 2026

Complutense University of Madrid

FRONTEND

- C++, C#, Python
- Consumption of REST APIs (basic)

WORK TOOLS

- GIT & Github
- Perforce
- Jira
- Visual Studio / Rider

ENGINES

- Unreal Engine 5
- Unity

DEVELOPMENT

- Algorithms & data structures
- Performance optimization
- Testing & QA
- Debugging & bug fixing

SOFT SKILLS

- Teamwork
- Problem solving
- Communication
- Adaptability

LANGUAGES

- Spanish
- English
- German

FRANCISCO PIEDRA

Gameplay Programmer | Technical Designer

SOBRE MÍ

Software Developer focused on gameplay systems, Unreal Engine 5 and interactive game logic. I have hands-on experience working with C++, Blueprints, Unity, C#, debugging, QA-oriented development and technical problem-solving.

I am currently developing RatRace, an Unreal Engine 5 project where I work on gameplay architecture, event-driven systems, UI/gamepad interaction, triggers, using C++ and Blueprints.

My background combines gameplay programming, system design and collaboration with designers and artists. I am especially interested in creating clean, maintainable and extensible gameplay systems that support player experiences.

ESPECIALIZACIONES

- C++ and Blueprint integration
- Git, GitHub, Perforce and version control workflows
- Agile methodologies, Scrum and Jira
- Performance optimization and platform-aware development
- Object-oriented programming, algorithms and data structures
- Debugging, bug fixing and technical problem solving
- Teamwork, communication and adaptability
- Testing, QA and code reliability

EXPERIENCIA

RATRACE — UNREAL ENGINE 5 PROJECT

Gameplay Programmer/Technical Designer | Development | 2025 - Present

RatRace is a 3D action-adventure puzzle game currently in development in Unreal Engine 5, focused platforms and speedrunning.

My contribution is especially related to the development of modular systems that allow designers to control how the player progresses through the game, including event-driven interactions, puzzle-related conditions, UI behaviour. This project has helped me improve my understanding of Unreal Engine workflows, Blueprint/C++ communication, debugging, technical iteration and collaboration inside an existing codebase and solving technical issues and making tools and components easier to use for the rest of the team.

WONDERS OF THE DEEP (UNITY)

Personal / Independent Project — Published on Steam | 2023 - 2025

Wonder of the Deep is an independent project published on Steam in which I worked as one of the main programmers. My contribution focused mainly on gameplay systems and AI behaviour, especially the development of an optimized flocking system used to simulate groups of fish moving naturally through the underwater environment. I implemented behaviours such as separation, alignment and cohesion, and improved performance by applying a spatial grid approach to reduce the cost of neighbour detection. This project helped me strengthen my understanding of simulation systems, performance-conscious programming and AI behaviour implementation in Unity using C#.
